Supplemental Figure

Characterization of the spinal cord dorsal horn of EP2\(^{-/-}\) mice. Transverse sections through the thoracic spinal cord of age matched EP2\(^{-/-}\) mice and wild-type mice were stained with antibodies directed against glycine, glycine transporter 2 (GlyT2), calcitonin gene-related peptide (CGRP) and the glycine receptor \(\alpha3\) (GlyR\(\alpha3\)) subunit. Note the absence of structural abnormalities in EP2\(^{-/-}\) mice.
