Supplemental Fig 1. Representative flow cytometric analyses of BM cells from $Mll^{wt/wt}$ and $Mll^{ptd/wt}$ mice taken between weeks 12-20, demonstrating no significant differences between these two genotypes. These data are also representative of results obtained in spleen and blood from these two genotypes, with the exception of Ter119 expression in spleen as shown above in Figure 6B and 6C. Staining and analysis were performed on N = 5 mice/genotype as previously described (40).
