Supplemental Figure 1. Cells isolated from grossly recognizable granulomas of αIL4TKO mice (24 wk of age) were stained with FITC-CD11c mAb and PE-F4/80, -MOMA-1, or isotype IgG. Expressions of CD11c versus F4/80 (middle panel) or MOMA-1 (bottom panel) are shown.
Supplemental Figure 2. Double staining of granuloma with anti-F4/80 mAb (blue) and anti-CD11c mAb (red) is shown. Aggregations of F4/80+CD11c+ cells that are recognized by the purple color (arrows) are observed.
